

1. Palindrome of a Number Using Recursion

```
def is_number_palindrome(num):  
    def reverse_number(n, rev=0):  
        if n == 0:  
            return rev  
  
        return reverse_number(n // 10, rev * 10 + n % 10)  
  
    return num == reverse_number(num)  
  
num = int(input("Enter a number: "))  
  
if is_number_palindrome(num):  
    print("Number is a palindrome")  
else:  
    print("Number is not a palindrome")
```

2. Palindrome of a String Using Recursion

```
def is_string_palindrome(text, start, end):  
    if start >= end:  
        return True  
  
    if text[start] != text[end]:
```

```
    return False
```

```
    return is_string_palindrome(text, start + 1, end - 1)
```

```
text = input("Enter a string: ")
```

```
if is_string_palindrome(text, 0, len(text) - 1):
```

```
    print("String is a palindrome")
```

```
else:
```

```
    print("String is not a palindrome")
```
